BROKO AI PLATFORM

Pre-Sprint Module Briefing

A discussion document — not a formal sprint plan

Pankaj Arora, CEO & Broker of Record | Broko Realty & Broko Technology | 2026

How to use this document:

Read through your module. Understand where we are, where we want to get to, and what questions to think about. Come back ready to discuss. This leads into our sprint planning session.

The Big Picture

We are running two companies at the same time, and everyone needs to understand how they connect.

Broko Realty Limited is our Ontario brokerage — RECO-regulated, licensed, and the first client of everything we build. Every feature, every bot, every automation — Broko Realty uses it first. They are our proof of concept.

Broko Technology Limited is our software company. We are building an AI platform that automates everything a real estate brokerage needs to run. Once we prove it works at Broko Realty, we sell it to other brokerages across Canada and then North America as a SaaS product.

The north star: become the #1 AI-powered real estate brokerage AND the #1 real estate technology provider in Ontario within 1-2 years. $25-35M seed round within 6 months.

The core principle — keep this in mind for everything:

"Agents only sell. AI handles everything else."

Every repetitive task a human does — we automate it. Every output our AI produces — it learns and improves from the next one. This is the product.

The three things agents hate most (priority order for what we build):

- **CMA preparation — takes agents 2-3 hours manually. We do it in 10 seconds.**
- **Lead generation and follow-up — agents need a steady pipeline. We automate capture, scoring, and nurturing.**
- **Paperwork and offer-to-close — OREA forms, e-signing, deal tracking — all automated.**

One important data architecture rule — everyone must know this:

- **Sensitive MLS and VOW data NEVER leaves our AWS environment. This is a legal requirement from PropTx and CREA.**
- Claude AI is only used for things like report writing, compliance Q&A, and bot conversations — never for raw listing data.
- Our CMA model, lead scoring model — these run entirely on AWS. This is non-negotiable.

MODULE 01 Marketing & Brand

Owner: Megha (Ma10) + Brandlume (Ve1)

1. What we want to achieve

- Make Broko the most recognised AI real estate brand in Ontario within 6 months
- Every Ontario buyer, seller, and real estate agent should know the Broko name
- Generate consistent, qualified leads from SEO, paid ads, and social — at under $25 per lead
- Rank in the top 3 on Google for 20+ high-intent Ontario real estate keywords
- Build Broko Pulse into the go-to source for Ontario real estate market intelligence
- Position Broko as a technology company that does real estate — not just another brokerage
- Agent marketing kits auto-generated — every agent gets branded materials in 60 seconds at onboarding
- Weekly competitor monitoring automated — what are HouseSigma, Zolo, RE/MAX doing and how do we stay ahead

2. Where we are right now

- Brandlume is managing SEO and paid ads — need to review current lead numbers and cost per lead
- Social media is being managed by Haresh — posting cadence and engagement numbers need review
- No confirmed neighbourhood SEO pages live yet — this is a major opportunity
- Broko Pulse content — need to confirm if it is being updated regularly and what is performing
- Brand guidelines — need to confirm if a formal document exists
- Agent marketing kit — not yet automated, currently manual if it exists at all
- Innovation Board Bot — not yet built, competitor monitoring is manual right now

3. Questions to think about and discuss

1. What leads per month are we currently generating from each channel — Google, Meta, organic, referral?
2. What is our cost per lead right now on Google vs Meta — and what is the ROAS?
3. Which keywords are we ranking for and which ones are competitors ranking for that we are not?
4. Is Brandlume following our brief accurately — what do they deliver weekly?
5. Which social platform drives the most engagement and leads for us right now?
6. Are agents sharing Broko content on their own profiles — how do we make this easier?
7. What is our domain authority score and how does it compare to HouseSigma and Zolo?
8. Do we have a PR strategy — press releases, industry publications, podcast appearances?
9. Should we position as a technology company or a brokerage first in all communications?
10. Are we retargeting people who used Bestimate but did not convert — this is a high-intent audience
11. What does Megha think is the single biggest marketing gap right now?
12. Is there a plan for French content — Quebec expansion will need this eventually
13. What is the agent recruitment marketing campaign — how do we attract agents from other brokerages?

Tech & things to keep in mind

- Claude AI generates content briefs, captions, and 7-day social calendar batches — Megha approves, does not write from scratch
- Semrush API for automated weekly keyword and competitor monitoring
- Canva API for agent marketing kit auto-generation at onboarding
- n8n orchestrates the full marketing automation pipeline
- Innovation Board Bot will run every Sunday and deliver CEO brief every Monday 8am — zero manual research
- SEO data feeds back to Claude weekly → Claude generates new targets → loop runs automatically

---

MODULE 02 Paid Advertising & Lead Campaigns

Owner: Brandlume (Ve1) + Deepanshu (Br5)

1. What we want to achieve

- Every rupee spent on advertising produces a measurable, trackable lead — no leakage

- Full funnel automated from ad click to CRM entry to agent notification — no manual steps
- Google Search targeting high-intent keywords — "Toronto real estate agent", "buy condo Mississauga", "sell home Brampton"
- Meta lead gen campaigns for buyers, sellers, and agent recruitment
- Dedicated landing pages per campaign — not the homepage
- Retargeting campaigns for Bestimate users who did not convert
- Auto-pause rules — if cost per lead exceeds threshold, campaign pauses and budget shifts to winner automatically
- 500+ qualified leads per month at under $25 cost per lead

2. Where we are right now

- Campaigns are running but need a full performance review — current CPL and ROAS unknown
- Lead capture from Meta and Google into CRM — need to confirm if this is automated or manual
- Landing pages — need to confirm if dedicated pages exist per campaign or if traffic goes to homepage
- Bestimate retargeting — not confirmed if this is running
- Agent recruitment ads — not confirmed if these are active
- Creative A/B testing — not confirmed if multiple variants are running simultaneously

3. Questions to think about and discuss

1. What is the current monthly budget split between Google and Meta?
2. What is the actual CPL and ROAS on each channel right now — can we see the numbers?
3. Are we using Performance Max or manual campaigns — what is the rationale?
4. Do we have dedicated landing pages for each campaign or is everything going to the homepage?
5. Are we retargeting Bestimate users — if not, why not?
6. Are we running agent recruitment ads on LinkedIn and Meta?
7. How quickly does Brandlume respond when a campaign underperforms?
8. Do we have Meta Pixel and Google Tag Manager set up correctly on broko.ai?
9. What ad creative has performed best historically — video, static, carousel?
10. What is the click-to-lead conversion rate on our current landing pages?
11. What does Deepanshu do day-to-day to oversee Brandlume — what is the review process?
12. Are pre-construction leads being handled differently — they have a different buyer journey

Tech & things to keep in mind

- Meta Lead Gen API and Google Ads API must feed directly into CRM — zero manual entry ever
- Claude generates 10 new ad copy variants per week — Brandlume implements the top performers
- Auto-pause rules via n8n — CPL above $30 → campaign pauses, budget shifts automatically
- Retargeting audiences built automatically from CRM converted leads as lookalike seed

---

MODULE 03 SEO, Content & Organic Growth

Owner: Megha (Ma10) + Haresh (Ma11) owner:pankaj, ivan,abhisek

1. What we want to achieve

- In 12 months, 40% of our leads come from organic search — not paid ads
- 500+ programmatic neighbourhood pages live — each one ranking for long-tail Ontario real estate searches
- Broko Pulse becomes the go-to Ontario real estate market intelligence publication
- Top 3 Google ranking for 20+ high-intent Ontario real estate keywords
- Every listing on broko.ai has an SEO-optimised AI-written description
- Every agent gets a public SEO-optimised profile page
- Organic traffic at 10,000+ monthly visitors by Month 6
- SEO is a compounding asset — the longer we run it, the bigger the lead volume without ad spend

2. Where we are right now

- Domain authority score — need to confirm current number vs competitors

- Keyword rankings — need full audit of what we are ranking for today
- Neighbourhood pages — not confirmed if any are live
- Broko Pulse — cadence and traffic numbers need review
- Backlink profile — need to know if we have any quality backlinks from real estate media
- Google My Business — need to confirm if it is set up and optimised for local search
- Agent profile pages — not confirmed if these exist on broko.ai

3. Questions to think about and discuss

1. What is our current domain authority and how does it compare to HouseSigma and Zolo?
2. What keywords are we currently ranking for — even outside the top 10?
3. Do we have any backlinks from real estate publications or industry sites?
4. Is Google My Business set up for Broko Realty — are we showing in local Ontario searches?
5. How many Broko Pulse articles are live and which ones get the most traffic?
6. Are neighbourhood pages live or still planned — what is the technical status?
7. What MLS data do we have access to for populating neighbourhood page stats?
8. How often is content being published currently — what is the weekly cadence?
9. Should we create content targeting agent recruitment — "join Broko Realty" type pages?
10. How do we handle duplicate content risk across 500+ similar neighbourhood pages?
11. What is the internal linking plan — how do pages link to each other and to listings?
12. Is there a French language content plan for Quebec expansion?

Tech & things to keep in mind

- Next.js Static Site Generation builds all 500+ neighbourhood pages automatically — one template, unlimited pages
- Claude writes neighbourhood summaries, listing descriptions, and article drafts
- Semrush API tracks keyword rankings automatically every week
- MLS data auto-updates neighbourhood page pricing stats as new sales close
- Schema.org structured data on all pages for Google rich snippets

---

MODULE 04 Consumer Platform — Website & App

Owner: Subhashis (Ma7) + Souvik (Ma8) + Souradip (Ma6)

owner: debasis

1. What we want to achieve

- broko.ai becomes the best property search experience in Ontario — faster and smarter than anything else
- Free-flow natural language search — "3 bed house near good schools in Oakville under $900K" — working perfectly
- Bestimate is the hero of the homepage — every visitor knows about our AI valuation tool
- Above-fold lead capture on the homepage — every visitor has an easy way to connect
- Mobile app rated 4.5+ in both app stores — agents and clients actually use it daily
- AI chat widget running 24/7 — capturing leads while agents are sleeping
- Price alerts keeping buyers engaged — they come back every time we alert them
- Full VOW compliance — Terms of Use gate, sold data behind login, correct branding throughout
- AODA accessibility — WCAG 2.1 Level AA across the entire platform
- Page loads in under 2.5 seconds — speed is part of the product experience

2. Where we are right now

- Homepage — hero image is 3840px and killing page load speed. Needs WebP compression immediately.
- Footer — still shows Re/Max branding. This is a legal risk. Must be fixed today.
- VOW Terms of Use gate — not confirmed as live before MLS data. Legal risk.
- Free-flow search — built but needs QA with 100+ test queries before production
- Bestimate — exists but needs to be the primary hero CTA, not buried
- Mobile app — current rating and top complaints need review
- AI chat widget — not confirmed as live on the website

- Price alerts — not confirmed as live with subscribers
- AODA audit — not confirmed as completed

3. Questions to think about and discuss

1. What is the current homepage conversion rate — visitors to leads — and where do users drop off?
2. What does the Hotjar heatmap data show right now — where are users clicking and where do they leave?
3. Is the Re/Max footer branding completely removed from broko.ai — this needs to be confirmed today
4. Is the VOW Terms of Use gate live before any MLS or sold data is shown?
5. What percentage of free-flow search queries currently return relevant results?
6. What are the most common queries that fail in free-flow search right now?
7. What is the current iOS and Android app rating — what are users complaining about?
8. Is the AI chat widget live — if not when does it go live?
9. Are price alerts live — how many subscribers do we have?
10. What is the current LCP score in Google PageSpeed Insights?
11. Is AODA accessibility audit done — what issues were found?
12. What features do users engage with most on the website — what does the data show?
13. Should there be a dedicated "for agents" landing page explaining why they should join Broko?
14. What does Souradip think needs to be fixed in the mobile app before we promote it heavily?

Tech & things to keep in mind

- Compress hero image to WebP under 200KB — do this Week 1, it is the easiest win
- Claude API handles free-flow search query parsing — all result data stays on AWS
- Hotjar analysis fed to Claude weekly → Claude recommends homepage changes → continuous improvement loop
- Firebase Cloud Messaging for push notifications on iOS and Android
- AWS Cognito for authenticated agent portal — separate from consumer site
- Axe DevTools integrated into CI/CD — zero new AODA violations can ever be deployed

---

MODULE 05 CMA & Property Intelligence

Owner: Thrilok (Ma3) — Primary Technical Lead Owner: Thrilok

1. What we want to achieve

- The most accurate and fastest CMA engine in Ontario — 99% accuracy, report in 10 seconds
- Agents prepare for listing presentations in 10 seconds instead of 3 hours — this is the #1 recruitment hook
- Bestimate gives sellers an instant online valuation on broko.ai — drives consumer leads
- Renovation cost estimator — buyers can see what it would cost to renovate and what that adds to value
- Neighbourhood intelligence on every listing — schools, transit, walkability, comparable sales
- Self-improving model — every agent rating on a CMA triggers automatic retraining on Sunday night
- The CMA model is our core IP — 2+ years of proprietary development, never shared externally
- Three-pillar approach: Hard Value (specs), Soft Features (qualitative), Market Analysis (comparables and trends)

2. Where we are right now

- CMA model is live in production — accuracy metrics need review (current MAPE unknown)
- Some property types and geographic areas have higher error rates than others — need to identify which
- CMA branded PDF report — need to see what it looks like today and whether agents are actually using it
- Agent rating feedback loop — not confirmed as live — this is critical for self-improvement
- Bestimate on broko.ai — exists but needs to be more prominent
- Renovation cost estimator — not confirmed as built
- Neighbourhood intelligence data — not confirmed as integrated into listing pages
- Model retraining — not confirmed as automated — need to know if it runs manually or on schedule

3. Questions to think about and discuss

1. What is the current MAPE of the CMA model — broken down by property type and area?

2. Which property types have the highest prediction errors right now — luxury, condo, rural?
3. Which Ontario areas have the weakest model performance — where is our sold data thin?
4. How many sold data points is the model currently trained on and how far back does the data go?
5. Is model retraining currently manual or automatic — and how often does it run?
6. What does a current CMA report output look like — can we see a sample today?
7. Is the agent thumbs up/down rating system live on the CMA — if not when?
8. How are we handling the cold start problem for new neighbourhoods with limited sold data?
9. What is Thrilok's plan to get from current accuracy to 99% — what are the biggest levers?
10. Can agents add manual adjustments on top of the AI estimate — and does that feed back into training?
11. What renovation cost data source are we using for the estimator — is it current GTA pricing?
12. When will the CMA be fully demo-ready for a live investor meeting — what is the exact milestone?
13. Are we 100% sure that only summarised non-sensitive data goes to Claude API — never raw MLS data?

Tech & things to keep in mind

- XGBoost and Linear Regression models run entirely on AWS SageMaker — never leave the VPC
- MLflow handles model versioning and automated retraining pipeline — every Sunday night after 50+ ratings
- Claude API only receives summarised narrative inputs — never raw MLS or sold data
- ReportLab + AWS Lambda generates the branded PDF report in under 10 seconds
- This is the most important module for the investor pitch — Thrilok must be able to demo it live and defend the architecture
- CONFIDENTIAL — model weights, training data, and architecture are never shared outside the company

---

MODULE 06 Lead Generation, Scoring & CRM

Owner: Debasis (Ma4) + Arnab (Ma5) owner: debasis

1. What we want to achieve

- Every lead captured within 60 seconds from any channel — zero manual CRM entry ever
- Every lead scored by AI — 0 to 100 based on actual behaviour on the platform
- Hot leads (score 70+) get an AI voice call within 60 seconds of capture — before any competitor calls them
- Right lead to the right agent automatically — by territory, property type, and price range
- CASL consent captured and stored at every lead entry point — legally required
- AI nurturing sequences on WhatsApp, email, and SMS — triggered by behaviour, not a schedule
- CRM dashboards for every role — Admin, Team Lead, Realtor, Accounting, Reception — all seeing what they need
- Lead scoring model retrains automatically every Sunday based on real conversion outcomes

2. Where we are right now

- Current lead volume by channel — unknown, needs review
- CRM system — need to confirm what is in place, what data is in it, what is missing
- Lead capture automation — not confirmed if Meta API and Google API are feeding CRM automatically
- CASL consent capture — not confirmed at all entry points — this is a legal risk
- Lead scoring model — Thrilok to confirm status of v1
- AI voice call (Vapi.ai) — not yet live
- AI nurturing sequences — not confirmed as live
- CRM dashboards — basic version exists, all 5 role views need to be confirmed

3. Questions to think about and discuss

1. How many leads per month are we getting from each channel — website form, Meta, Google, chat widget?
2. Are leads entering the CRM automatically from Meta and Google or is someone doing this manually?
3. Is CASL consent being captured and stored for every lead right now — can we produce records if asked?
4. What happens to a lead that comes in at 2am on a Sunday — who handles it?
5. How does Ivan currently assign leads to agents — what is the manual process today?
6. What does the current CRM look like for agents — what can they see and what is missing?

7. What data points does Thrilok think predict lead quality best based on current data?
8. How should investor leads be handled differently from end-user buyer leads?
9. Should the AI voice call disclose it is an AI — what does CRTC require?
10. What makes a lead go cold — what behavioural signals should we detect early?
11. Are there leads currently falling through the cracks — not being followed up at all?
12. What is the current average response time from lead capture to agent first contact?
13. Can agents see each other's leads — should they be able to?

Tech & things to keep in mind

- Meta Lead Gen API and Google Ads API feed directly into CRM — if this is not live yet, it is Week 1 priority
- XGBoost lead scoring model runs on AWS — Redis for real-time score calculation
- Vapi.ai + ElevenLabs for AI voice call — 60 seconds from hot lead capture to phone ringing
- Wati.io for WhatsApp nurturing, Twilio for SMS, Mailchimp for email
- n8n orchestrates the entire pipeline — capture, deduplication, scoring, routing, nurturing
- Lead scoring model retrains every Sunday night via MLflow — every conversion outcome is a training signal

---

MODULE 07 Agent Recruitment & Onboarding

Owner: Ivan (Br4) + Mihail (Br3) owner: ivan, pankaj, mihail

1. What we want to achieve

- 30 agents signed and actively generating revenue by Month 2 — 100 by Month 6
- Best agents in Ontario want to join Broko because AI handles everything they hate
- Recruitment campaign running on LinkedIn and Meta targeting licensed Ontario agents
- Hiring Bot lets Ivan run personalised outreach to 100 prospects simultaneously with one instruction
- Onboarding fully automated — from signed agreement to first lead assigned in under 2 hours
- Training Bot available 24/7 — agents never wait for Mihail to answer a RECO compliance question
- Performance dashboard — every agent sees their own GCI, leads, response time, showings, closings
- Agent churn under 10% — agents stay because Broko genuinely makes their working life easier

2. Where we are right now

- Current agent count — need exact number and which brokerages they came from
- Recruitment campaign — not confirmed if LinkedIn and Meta agent recruitment ads are running
- Hiring Bot — not yet built, Ivan is doing outreach manually
- Onboarding flow — currently manual, Mihail does it one by one, takes 1-2 days per agent
- Training Bot — not yet built, Mihail answers compliance questions directly
- Performance dashboard — basic version may exist, all features need confirmation
- CMA demo for recruitment — need to confirm it is ready and polished for recruitment conversations

3. Questions to think about and discuss

1. What is our current agent count and what brokerages are they coming from?
2. What objection do agents raise most when Ivan approaches them — commission, tech, brand, something else?
3. How does our commission split compare to RE/MAX, Century 21, and Royal LePage right now?
4. What does the current onboarding process look like step by step — how long does it actually take?
5. Are we RECO-compliant in onboarding — are all required documents being collected and stored?
6. Is the CMA demo ready to show a prospective agent today — polished and impressive?
7. How is Ivan currently tracking the recruitment pipeline — what tool or process?
8. What agents at competitor brokerages are publicly frustrated — social media, Google Reviews?
9. Should we offer a joining incentive — signing bonus, tech subsidy, reduced split for first 3 months?
10. What does a new agent's first week at Broko look like — is there a structured plan?
11. Are current agents sharing feedback about the platform — what do they love and what frustrates them?
12. Should we build a referral programme — agents who refer other agents get a bonus?

Tech & things to keep in mind

- Claude AI powers the Hiring Bot — Ivan gives one instruction, 100 personalised messages go out
- n8n automates the full onboarding sequence — RECO check, DocuSign, portal access, training assigned
- DocuSign or Signwell for electronic agreement signing
- Training Bot built on Claude API with RAG — RECO Act, OREA forms, Broko SOPs all searchable
- QuickBooks Online for commission calculation — integrated with CRM deal data

---

MODULE 08 Transaction & Deal Management

Owner: Debasis (Ma4) + Mihail (Br3) owner: praveen

1. What we want to achieve

- Agents prepare an offer in 5 minutes instead of 45 — OREA form auto-filled from CRM data
- Every condition deadline has automated escalating alerts — 72hr, 48hr, 24hr, 4hr — to agent, admin, and lawyer
- No deal ever falls apart because something was missed or forgotten
- All documents e-signed via DocuSign — deal file assembled automatically on AWS, encrypted
- Deal tracker from accepted offer to close — every stage has a checklist, a responsible party, and a deadline
- FINTRAC ID verification documented for every transaction — consistent and audit-ready
- Commission calculated automatically when deal closes — QuickBooks updated without manual entry
- Dispute ticketing — logged with SLA tracking, P0 issues escalated to CEO within 1 hour

2. Where we are right now

- Offer preparation — currently done manually by agents, takes 45 minutes per offer
- OREA form auto-fill — not yet built
- Document signing — need to confirm what solution agents are using today
- Deal tracker — not confirmed as automated, Mihail may be tracking manually
- Condition deadline alerts — not confirmed as automated — high risk area
- FINTRAC documentation — not confirmed as consistent across all transactions
- Commission calculation — not confirmed as automated

3. Questions to think about and discuss

1. How long does it currently take an agent to prepare a complete offer package?
2. What OREA forms are used in almost every transaction — what should be automated first?
3. What errors do agents make most often when filling OREA forms — what gets missed?
4. Are condition deadlines currently being tracked — has a deadline ever been missed?
5. What signing solution are agents using today — DocuSign, paper, or something else?
6. Are all documents stored somewhere accessible — or are they scattered in agent email inboxes?
7. How does Mihail manage deal administration day to day right now?
8. What does FINTRAC ID verification look like currently — is it documented and consistent?
9. How do lawyers and mortgage brokers currently receive documents from us — email?
10. Should lawyers get read-only access to the deal file through the agent portal?
11. What happens when a deal falls through after conditions are waived — what is the current process?
12. Are there brokerage-specific clauses that must be in every offer — what are they?
13. Do agents need to prepare offers on mobile — are they in the field when doing this?

Tech & things to keep in mind

- Claude API auto-fills OREA form fields from CRM data — agent only reviews price, conditions, dates
- OREA form version monitoring — auto-detect when OREA releases new versions, update templates automatically
- DocuSign or Signwell — evaluate cost at scale, Signwell is significantly cheaper
- n8n sends condition deadline alerts — escalating urgency automatically, no human has to remember
- Every deal close feeds the CMA model — actual sale price vs AI estimate improves future predictions

MODULE 09 Multi-Bot AI System & Broko Brain

Owner: Thrilok (Ma3) + Vikas (Ma2) owner: Thrilok

1. What we want to achieve

- Every Broko staff member has an AI co-pilot available 24/7 that knows everything Broko knows
- Broko Brain — central knowledge base loaded with RECO Act, OREA forms, all Broko SOPs, past deals
- All 10 bots live by end of Month 2, all sharing Broko Brain, every answer citing its source
- BOR Bot on WhatsApp — Pankaj gets instant RECO compliance answers without hours of research
- Deal Admin Bot — Mihail gets automated checklists, FINTRAC guidance, closing reminders
- Agent Bot — agents get answers to any question at 3am without waiting for Mihail
- Compliance Check Bot — every offer runs through PASS/FAIL compliance check before submission
- AI Validation Bot — every AI output gets a confidence score, below 70 goes to human review
- Innovation Board Bot — CEO gets a Monday 8am strategy brief automatically, every week

2. Where we are right now

- Broko Brain — not yet built, Pinecone not yet provisioned
- No bots are currently live in production
- RECO Act, OREA forms, and SOPs — need to confirm if written SOPs even exist or if they are in people's heads
- BOR Bot — not built, Pankaj currently answers compliance questions from memory
- Compliance Check Bot — not built, no automated compliance checking on offers
- Innovation Board Bot — not built, competitor monitoring is manual

3. Questions to think about and discuss

1. Do we have written SOPs for Broko Realty — or does everything live in Pankaj and Mihail's heads?
2. What are the top 10 compliance questions agents ask Pankaj every single week?
3. What does Mihail's current deal administration checklist look like — does she have one written down?
4. What RECO rules are most commonly misunderstood or broken by agents?
5. How do we keep the knowledge base updated when RECO publishes new rules or OREA releases new forms?
6. What is the RAG chunking strategy for long regulatory documents like the RECO Act?
7. How do we test that the BOR Bot is giving accurate compliance answers — what is the evaluation process?
8. What languages should the bots support — English only or also French, Mandarin, Punjabi?
9. How does the AI Validation Bot detect hallucinations — what is Thrilok's technical approach?
10. Should agents see the confidence score on CMA outputs or just get flagged when it is low?
11. What data does the Market Intelligence Bot need to deliver to agents every morning?
12. How do we prevent the Compliance Check Bot from being too strict and blocking valid offers?
13. When all 10 bots are live, how does LangGraph orchestrate them as a unified software humanoid?

Tech & things to keep in mind

- Pinecone vector database on AWS PrivateLink — all bots query Broko Brain before answering
- LangChain for RAG pipeline — document retrieval and chain orchestration
- LangGraph for multi-agent orchestration — this becomes the software humanoid foundation
- Langfuse self-hosted for AI output monitoring and confidence scoring
- WhatsApp Business API so Pankaj can access BOR Bot directly from WhatsApp
- All 10 bots share Broko Brain — one knowledge base, every bot gets smarter as more content is added
- Every unanswered bot query is logged — becomes a new entry in the knowledge base automatically

---

MODULE 10 Data, Privacy, Compliance & Security

Owner: Mihail (Br3) + Praveen (Ma1) owner: debasis

1. What we want to achieve

- Broko is the most compliant AI real estate company in Canada — every regulator audit we pass

- CASL consent captured and stored for 100% of leads — records producible on demand
- FINTRAC ID verification documented for every single transaction — consistent and retrievable
- VOW compliance complete — ToU gate before MLS data, sold data behind login
- Data boundary enforced — MLS and VOW data never leaves AWS, enforced at infrastructure level
- MFA on every admin and agent account — no exceptions
- broko.ai protected by WAF and DDoS — no exposure to attacks
- AODA accessible — WCAG 2.1 Level AA across everything we build

2. Where we are right now

- Footer — Re/Max branding still showing. Legal risk today. Must be fixed immediately.
- VOW Terms of Use gate — not confirmed as live. Legal risk today.
- CASL consent — not confirmed as captured and stored at all entry points
- FINTRAC documentation — not confirmed as consistent across all transactions
- PIPEDA privacy policy — not confirmed as updated to mention AI processing
- MFA — not confirmed as enforced on all accounts
- WAF and DDoS protection — not confirmed as active on broko.ai
- API keys and secrets — not confirmed if stored in AWS Secrets Manager or hardcoded somewhere
- AODA audit — not confirmed as completed
- Data boundary audit — not confirmed as documented and signed off

3. Questions to think about and discuss

1. Has Broko ever had a formal legal compliance review done by a proptech lawyer?
2. Is CASL consent currently captured and stored for every lead — can we produce records if a regulator asks?
3. Is FINTRAC ID verification being done consistently for every transaction — is it documented?
4. Has a PIPEDA privacy impact assessment been done for our AI data processing?
5. Does our Privacy Policy mention AI and automated decision-making — PIPEDA may require this?
6. Are we registered with FINTRAC as a real estate broker?
7. Is the footer Re/Max branding completely removed from broko.ai and all marketing materials?
8. Has the data boundary architecture been documented and signed off — what goes to Claude vs what stays on AWS?
9. Is MFA enforced on all admin and agent accounts right now?
10. Are all API keys stored in AWS Secrets Manager — are any hardcoded in the codebase?
11. Has broko.ai ever been attacked — is there any WAF or DDoS protection currently?
12. Are we monitoring Bill C-27 (PIPEDA modernisation) — what would it change for our AI processing?
13. Should we engage a proptech-specialised compliance firm rather than a general lawyer?

Tech & things to keep in mind

- CASL violation = up to $10M fine — this is the most immediate financial risk, fix first
- AWS API Gateway enforces data boundary — blocks prohibited data from reaching external APIs
- AWS WAF + Cloudflare Pro for web protection
- AWS Secrets Manager for all API keys and credentials
- Axe integrated into CI/CD — zero new AODA violations can be deployed after setup
- MongoDB TTL indexes and S3 lifecycle policies for automatic data retention and deletion
- Compliance is ongoing — regulatory feeds monitored automatically, Mihail alerted within 48 hours of any change

---

MODULE 11 Platform Infrastructure, DevOps & Performance

Owner: Praveen (Ma1) owner: debasis

1. What we want to achieve

- broko.ai loads in under 2.5 seconds every time — speed is part of the product
- 99.9% uptime — agents and clients never see a down platform during a transaction
- API responses under 200ms — every feature feels instant

- Fully automated CI/CD pipeline — developers commit code, tests run, production deploys, all automatic
- Infrastructure as Code with Terraform — reproducible, version controlled, no manual server setup
- AWS costs under $3,500/month in Phase 1 — every dollar saved extends runway
- Auto-scaling — platform handles traffic spikes without anyone doing anything
- API-first architecture — every feature accessible via API, enabling future SaaS multi-tenancy

2. Where we are right now

- Current AWS bill — unknown, needs exact breakdown by service
- Current LCP score — unknown, needs Google PageSpeed check
- CI/CD pipeline — not confirmed if automated or if deployments are manual
- Terraform or IaC — not confirmed as in use
- Auto-scaling — not confirmed as configured
- Disaster recovery procedure — not confirmed as documented and tested
- Deployment access — not confirmed who has production access and whether it is restricted appropriately

3. Questions to think about and discuss

1. What is the actual current AWS bill broken down by service — can we see the Cost Explorer data?
2. What is the current LCP score in Google PageSpeed Insights for broko.ai?
3. What is the current API p95 response time for the most common endpoints?
4. Is there a CI/CD pipeline today or are deployments manual — if manual, who does them and how?
5. Is Terraform or any Infrastructure as Code tool being used to manage AWS resources?
6. Has there ever been a significant production outage — what caused it and how was it resolved?
7. Is there a documented disaster recovery procedure — when was it last tested?
8. Are ML model training jobs using Spot Instances or On-Demand — Spot is much cheaper
9. Is Claude API usage tracked per feature — which features cost the most?
10. Are there any AWS resources running that are no longer needed — zombie instances?
11. Who has production deployment access right now — should this be more restricted?
12. What does the architecture need to look like to support 10 external SaaS clients alongside Broko Realty?
13. Should we pursue SOC2 certification as part of SaaS readiness — what is the timeline and cost?

Tech & things to keep in mind

- Claude prompt caching saves 40-60% on AI API costs — implement before scaling any AI features
- Reserved Instances save 30-40% on EC2 compute costs vs On-Demand
- Self-hosting n8n, Langfuse, and Metabase saves $800-1,200/month vs cloud versions
- GitHub Actions for CI/CD — commit to production in under 10 minutes with all gates automated
- Docker and AWS ECS for containerised services — consistent from dev to production
- API-first refactor is the technical foundation of the SaaS business — every feature built this way

---

MODULE 12 QA, Testing & Platform Reliability

Owner: Tantusree (Ma9) + David (Br2) owner: tantusree, david

1. What we want to achieve

- Zero unstable releases ever reaching production — full automated test gate before every deployment
- 80% automated test coverage by Month 2 — developers ship fearlessly knowing tests catch regressions
- Every bug triggers an RCA within 24 hours — same bug cannot reach production twice, ever
- Automated test generated from every bug fix — self-healing system that gets more reliable over time
- AODA accessibility tested automatically on every build — zero new violations can be deployed
- Production stability so reliable that we can commit to SaaS clients on an uptime SLA
- Bug tracking in Linear with clear severity tiers and SLA for each — no bug gets lost

2. Where we are right now

- Current test coverage — unknown, needs Tantusree to audit

- Automated tests — not confirmed if any E2E or API tests are running
- Sentry error monitoring — not confirmed if live on broko.ai
- Bug tracking system — not confirmed what tool David is using if any
- CI/CD quality gate — not confirmed as in place
- Production stability — number of incidents in last 3 months unknown
- AODA in CI/CD — not yet integrated

3. Questions to think about and discuss

1. What is the current test coverage percentage for the broko.ai codebase?
2. Are there any automated tests running today — unit, integration, or E2E?
3. What is the most common type of bug that reaches production right now?
4. How does Tantusree currently discover bugs — user reports, her own testing, or monitoring tools?
5. Is Sentry or any error monitoring tool currently running on broko.ai?
6. How are bugs reported by agents and clients — email, WhatsApp, or something in-app?
7. What is the current average time from bug reported to bug fixed?
8. Are there recurring bugs that keep coming back after being fixed — why?
9. How does David track bugs and sprint items currently — what tool or process?
10. What parts of the platform are highest risk and need test coverage first?
11. Has Tantusree used Playwright before or would she need training on the tool?
12. How long does a full manual regression test take Tantusree today?
13. What happens when a critical bug is found during a live transaction — who responds and how fast?

Tech & things to keep in mind

- Write tests for ALL existing features before writing any new code — this is Week 1 priority for Tantusree
- Playwright for E2E tests and AODA accessibility — one tool covers both
- Axe DevTools in CI/CD — once set up, zero new AODA violations can reach production automatically
- Sentry for error capture — every production error becomes an RCA trigger automatically
- Linear for bug tracking — clear severity tiers, SLA per tier, escalation rules baked in
- Claude API for AI-assisted RCA — analyses error logs and suggests root cause, saves hours of investigation

---

MODULE 13 Finance, Accounting & Seed Round

Owner: Pankaj (Br1) — CEO owner: pankaj

1. What we want to achieve

- $25-35M seed round closed within 6 months
- CFO hired within 60 days — investors will not write a large cheque without professional financial governance
- Commission tracking automated — accurate to the cent, no manual calculation
- Monthly P&L generated automatically — investor-ready without manual compilation
- Burn rate dashboard — Pankaj sees actual vs budget weekly, auto-alert if burning faster than planned
- Investor updates drafted by Claude from CRM and financial data — Pankaj reviews and sends monthly
- Seed round deck complete — problem, solution, traction, tech moat, market size, team, ask
- Live product demo rehearsed and flawless — CMA in 60 seconds is the wow moment for investors

2. Where we are right now

- Current burn rate — exact number by category needs to be produced
- Current GCI — how many deals closed and total commission earned to date
- Current runway — how many months at current burn rate
- CFO — not yet hired, this is the most critical hire before the raise
- Cap table — need to confirm if a current document exists
- Investor deck — not yet complete
- Demo — needs to be rehearsed until it is flawless

- Investor pipeline — need to know who is in conversations and at what stage

3. Questions to think about and discuss

1. What is the exact current monthly burn rate — salaries, tools, marketing, rent, everything?
2. What is the current GCI from completed transactions — deals closed and total commission?
3. What is our current runway — how many months before we need the raise to close?
4. Has a CFO search started — what profile and what is the compensation budget?
5. Is there a current cap table document — is it accurate?
6. What are the reporting obligations to our pre-seed investors — what have we committed to?
7. What proof points do investors need to see — agent count, GCI, CMA accuracy, bot performance?
8. Should the raise be equity, SAFE notes, or convertible notes?
9. Which Canadian and US proptech VCs should we approach first?
10. Should we approach strategic investors too — large brokerages, REITs, PropTech funds?
11. Does Vikas have investor relationships from previous ventures we can use?
12. What is the investor demo sequence — what do we show and in what order?
13. What is the plan if we cannot reach $25-35M — would $15-20M at a lower valuation work?
14. How do we explain the data moat to investors — why competitors cannot catch up?

Tech & things to keep in mind

- CFO hire is the #1 priority before any major investor meetings — this is not optional
- Docsend for data room — tracks which investors opened which sections, intelligence for follow-up
- Claude drafts monthly investor updates from CRM and financial data — Pankaj reviews and sends
- QuickBooks Online for accounting integrated with CRM commission data
- The demo must be FLAWLESS — Vikas and Thrilok practice until CMA in 60 seconds is seamless

---

MODULE 14 Humanoid & Future Technology

Owner: Vikas (Ma2) + Thrilok (Ma3) owner: praveen, thrilok

1. What we want to achieve

- Software humanoid demo v1 ready by Month 3 — for investors and for our own proof of concept
- All 10 bots orchestrated by LangGraph into a unified system that handles a complete buyer journey without human intervention
- Open house iPad kiosk pilot at first property by Month 5-6 — visitor signs in, AI greets them, qualifies, books follow-up
- Physical humanoid roadmap defined — hardware partner identified, RECO compliance monitoring ongoing
- First brokerage in the world with an AI agent hosting open houses — massive PR and investor story
- Everything we build in software becomes the brain of the physical humanoid when regulations permit

2. Where we are right now

- All 10 bots are still being built — software humanoid requires all bots to be live first
- LangGraph orchestration architecture — not yet designed, Vikas to present
- Open house kiosk — no hardware pilot planned yet, no property identified
- Physical humanoid R&D — no hardware partner identified yet
- RECO compliance monitoring for AI agent autonomy — not confirmed as active

3. Questions to think about and discuss

1. What is Vikas's technical vision for the LangGraph multi-agent orchestration architecture?
2. Which brokerage role does Thrilok think is easiest to automate fully as the starting point?
3. What is the acceptable response latency for the software humanoid — 1 second, 3 seconds, 5 seconds?
4. How do we handle context loss when a conversation spans multiple bots in a chain?
5. Should the humanoid have a name and a persona — what would Broko want it to be called?
6. What does a passing software humanoid demo look like — what must it do for investors to be impressed?
7. What compliance approval would RECO need to give before an AI can independently host an open house?

8. Who is building relevant robot hardware — has Vikas identified any potential partners?
9. What is the open house kiosk experience from a visitor's perspective — walk through it step by step
10. How many languages should the open house bot support from day one?
11. What data from an open house gets sent to the agent — and in what format?
12. Should the open house bot disclose it is an AI — what does RECO currently say about this?

Tech & things to keep in mind

- LangGraph orchestrates all 10 bots as one unified system — the humanoid is not new technology, it is existing bots working together
- ElevenLabs for voice synthesis — humanoid speaks in a consistent branded voice
- Vapi.ai for real-time voice conversation management
- FastAPI and WebSockets for low-latency real-time communication
- iPad Pro for the open house kiosk — test hardware reliability before committing to rollout
- The software humanoid demo for investors is the most powerful moment in the pitch — it shows the vision is real and near-term

What Happens Next

This document goes to each team member before we meet. They read through their module. They think about the questions. They come back with:

- Where things actually are right now — honest status, no spin
- Answers to the discussion questions — what they know and what they do not know yet
- Blockers — what they need from you or from other teams before they can move
- Their own questions — things they need clarity on
- Time estimates — how long the key items in their module will take

Then we sit down together and do proper sprint planning. We lock Week 1 and Week 2 tasks, define the Month 1 milestone, and load everything into Notion with ticket IDs, owners, and priorities.

"Agents only sell. AI handles everything else."

— Broko AI Platform Core Principle
